PHISHING ANALYSIS REPORT

Assessment Window: 3 April – 5 April
Analyst: Rakib Nadir

Authorization & Confidentiality Statement

All analysis documented in this report was conducted in a controlled environment using a fabricated sample email constructed solely for educational, training, and methodology demonstration purposes, and no real individuals, live malicious infrastructure, or third-party systems were actively engaged or tested. This report ("Report") is confidential and proprietary to the assessor and is intended solely for internal review, client delivery, and professional documentation purposes; the phishing scenario, indicators of compromise, domain names, IP addresses, and artifact details presented herein are illustrative examples designed to reflect real-world attack patterns for security awareness and analyst training. The contents of this Report, including all findings, analysis, and defensive recommendations, are provided for educational, validation, and security improvement purposes only, and this Report, in whole or in part, shall not be reproduced, distributed, or disclosed to any third party without prior written authorization from the assessor. Unauthorized use, disclosure, or distribution of this Report may result in misuse of sensitive security methodology and could expose analytical tradecraft to unnecessary risk, and no liability is assumed by the assessor or its analysts for any unauthorized use of the information contained within this Report.

1. EXECUTIVE SUMMARY

On 16 September 2022, a suspicious email was reported and submitted for forensic analysis, purporting to originate from Amazon Prime and alerting the recipient, asmith@hotmail.com, of an unusual sign-in activity on a new device, employing a sense of urgency through a ticket reference number in the subject line to pressure the recipient into immediate action. Header analysis revealed that despite the sender display address appearing as cafepress@mail.cafepress.com, the Return-Path exposed an entirely unrelated bulk mail domain, imdreampores.ovh, and the sender IP 209.85.221.104 resolved to a Google mail server with no affiliation to Amazon whatsoever, confirming deliberate sender spoofing through a third-party sending infrastructure. All three email authentication mechanisms, SPF, DKIM, and DMARC, returned failure status, further confirming that the email does not originate from any authorized source for the claimed domain. The embedded URL within the call-to-action button, hxxps://cabinetlekagni[.]com, was found to be malicious upon reputation analysis, flagged by 11 out of 95 engines on VirusTotal and 4 out of 35 sources on URLVoid, redirecting victims to a credential harvesting portal disguised as an Amazon Prime login page designed to steal account credentials. No attachment was identified in this email sample. The overall verdict is malicious with high confidence, and immediate containment actions including blocking the sender address and malicious domain on the email gateway, EDR, and web proxy have been applied.

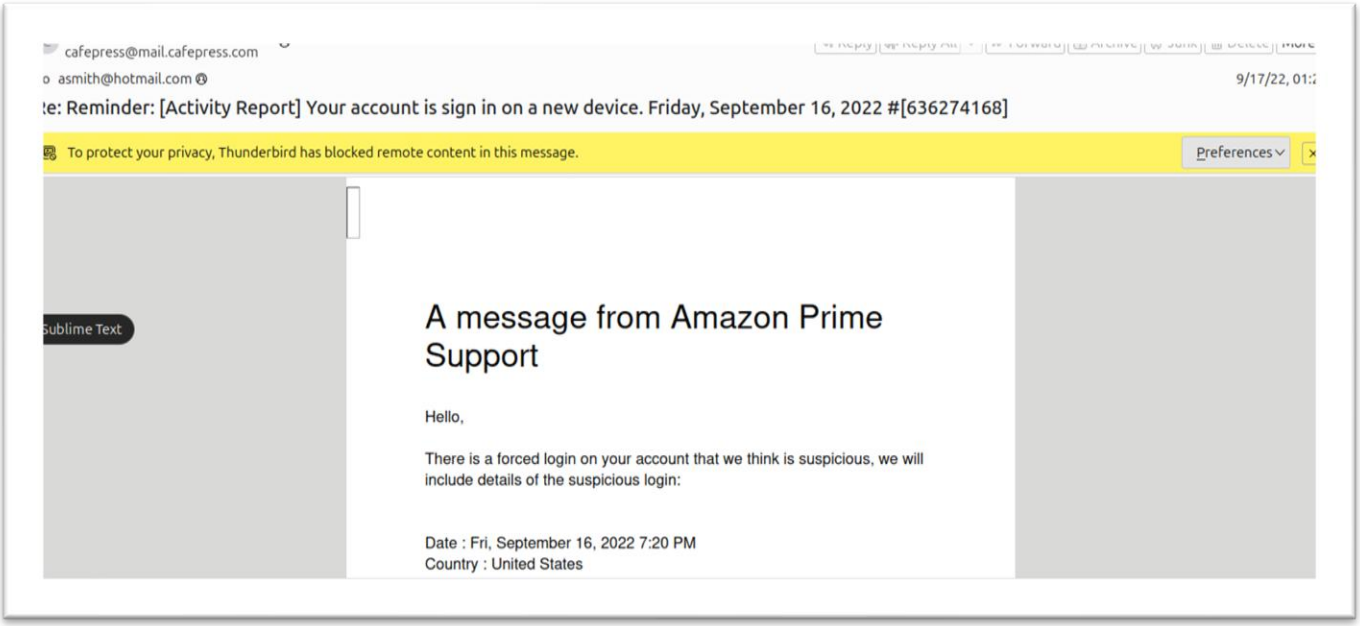
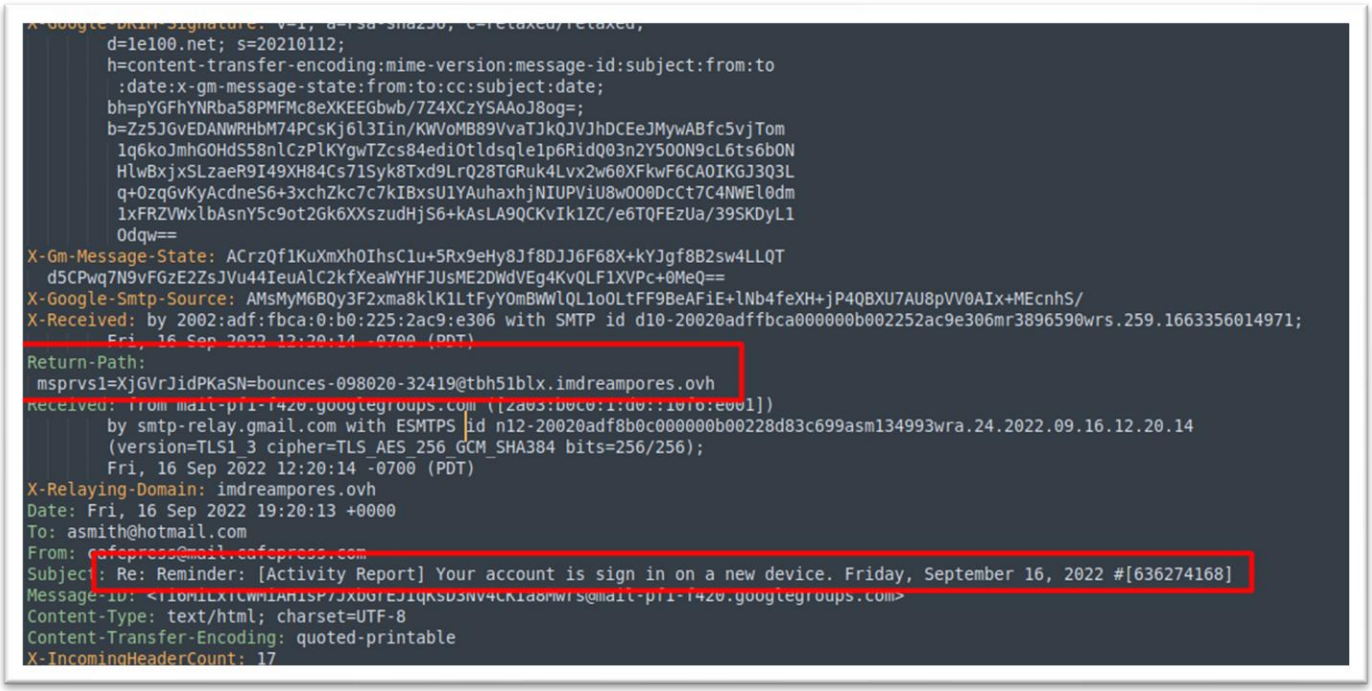
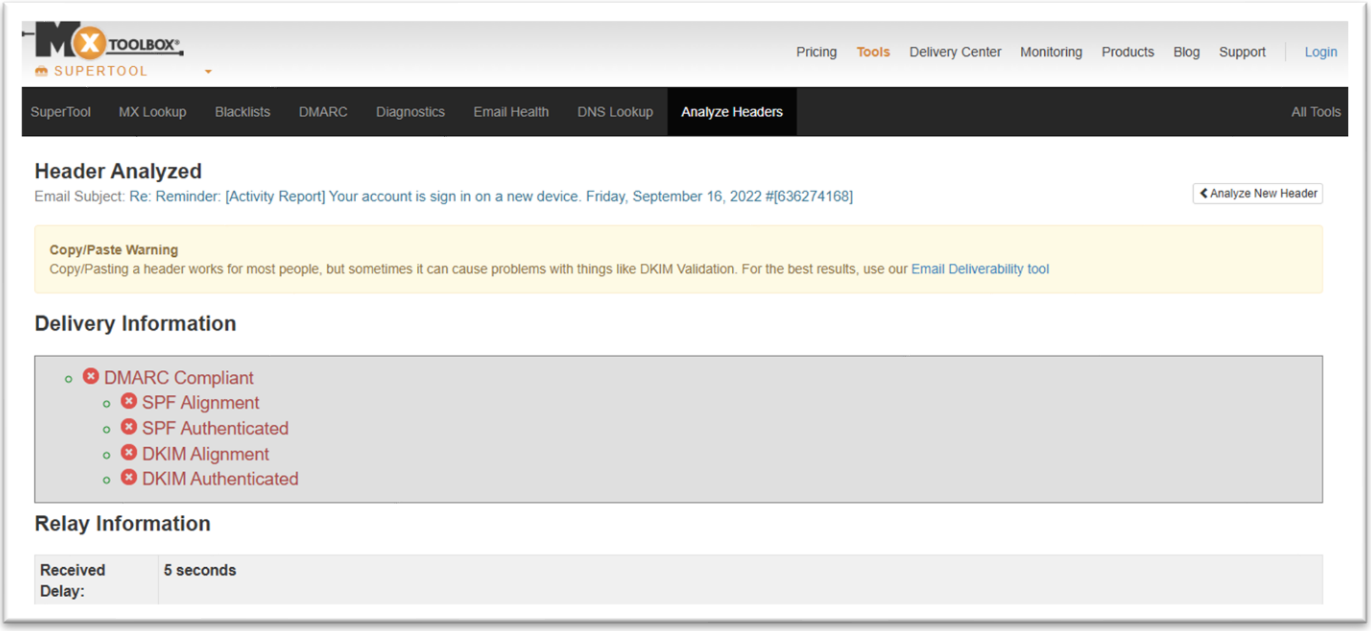
1. Email Overview



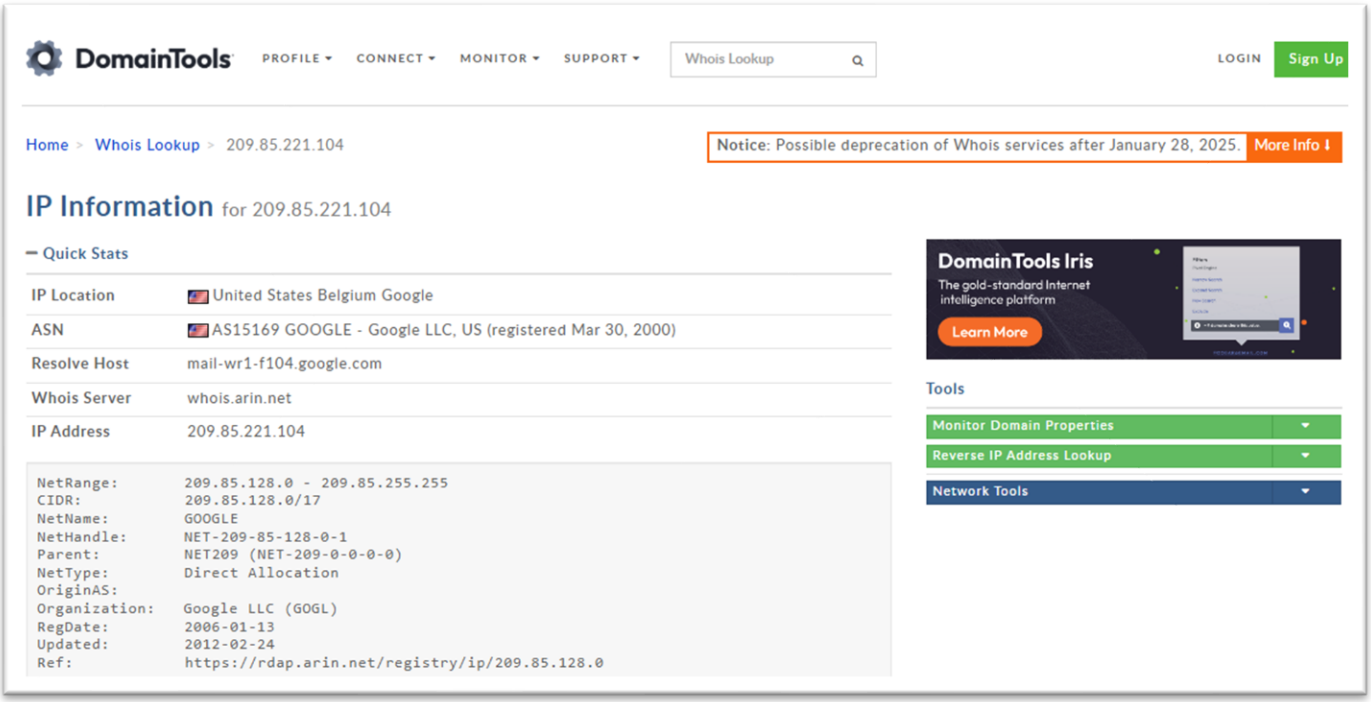
2. Suspicious Return – Path Identified



3. SPF, DKIM, DMARC Failures



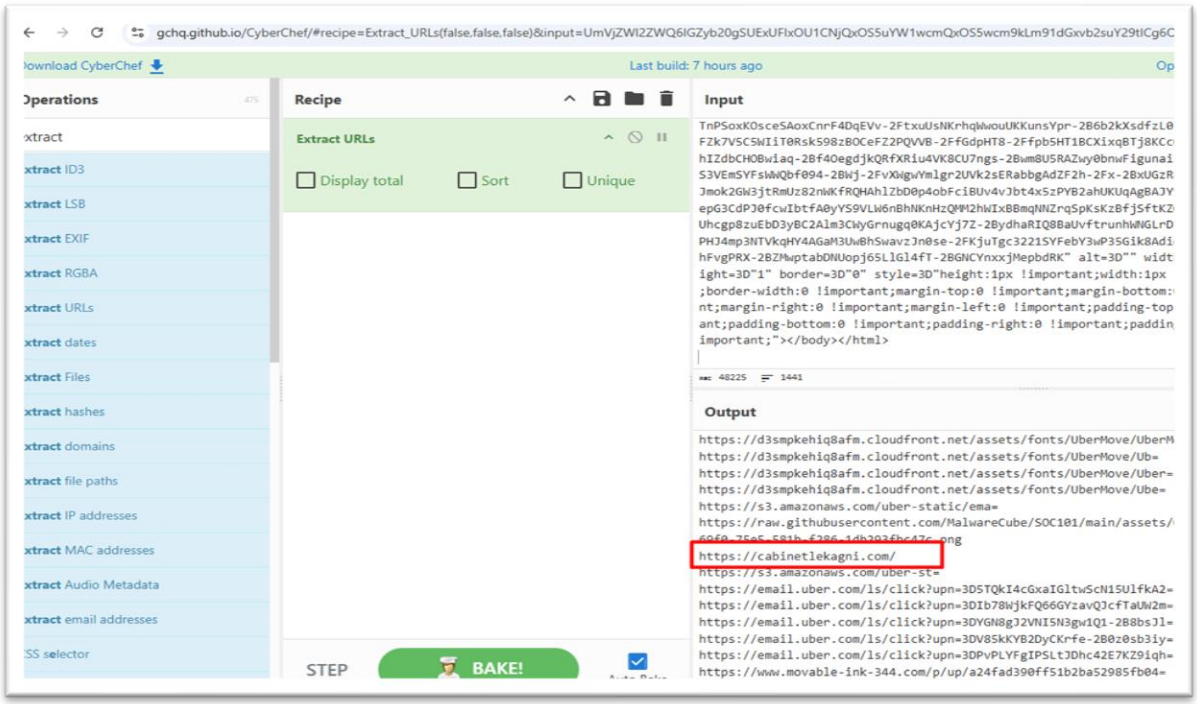
4. Resolve – host is not Related to AWS



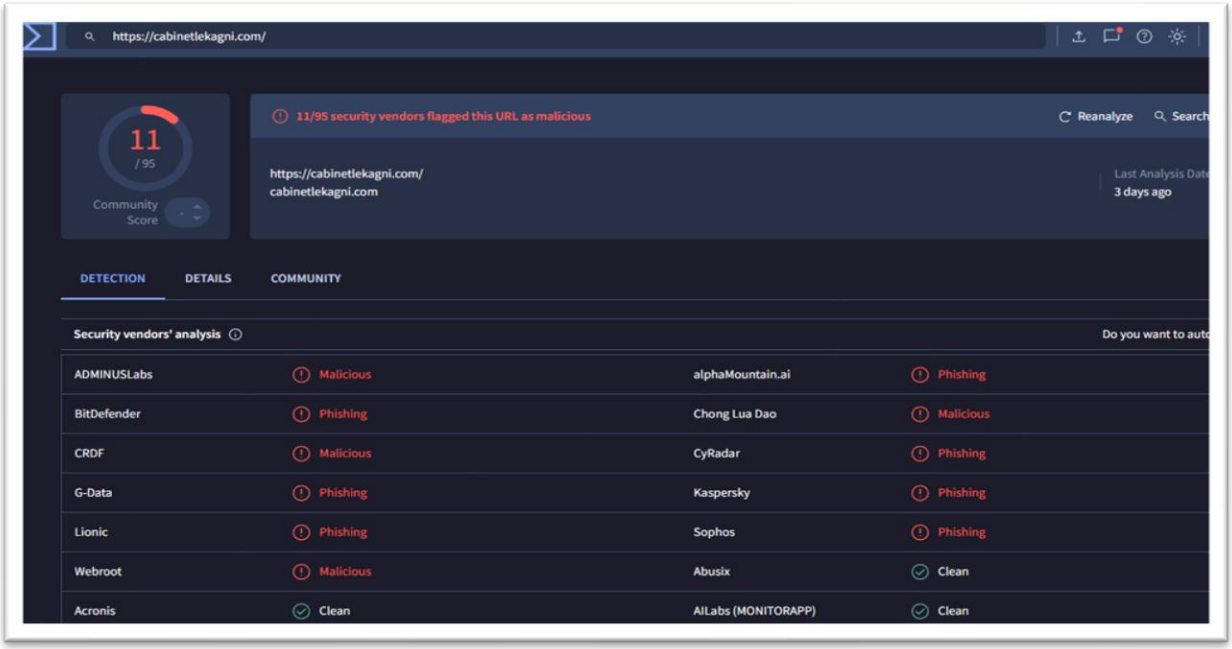
2. EMBEDDED URLs

Raw URL	https://cabinetlekagni.com/
Displayed As	Amazon Prime Login Page
VirusTotal	11/95 security vendors flagged this URL as malicious
URLVoid.com	Detection Counts 4/35

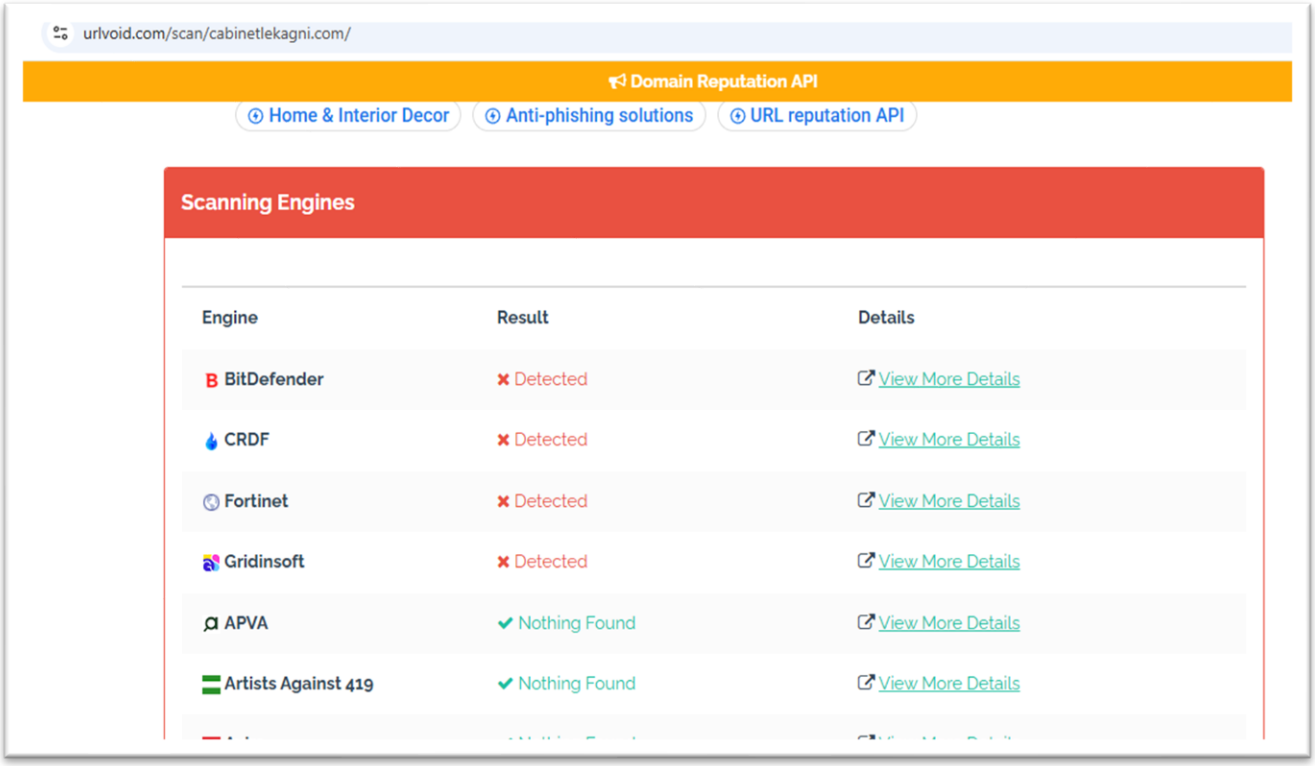
1. Suspicious Url



2. Virus Total flagged this Url as malicious



3.URLVoid.com Detects this site as malicious



3. ATTACHMENTS

No attachment was identified in this email sample. The email relied solely on a malicious embedded URL as its attack vector.

4. DESCRIPTION

The email, received on 16 September 2022, presents itself as an Amazon Prime account activity alert addressed to asmith@hotmail.com, notifying the recipient of a new device sign-in and urging immediate action through a sense of urgency reinforced by a ticket reference number in the subject line. Despite the sender display address appearing as cafepress@mail.cafepress.com, the Return-Path reveals a completely unrelated bulk mail domain, imdreampores.ovh, and the sender IP 209.85.221.104 resolves to a Google mail server, mail-pf1-f420.googlegroups.com, that has no legitimate association with either Amazon or CafePress, indicating deliberate sender spoofing through a compromised or rented sending infrastructure. All three email authentication mechanisms, SPF, DKIM, and DMARC, returned failure status, confirming that the email does not originate from any authorized sending source for the claimed domain. The embedded URL, hxxps://cabinetlekagni[.]com, is disguised as an Amazon Prime login page and was flagged as malicious by 11 out of 95 engines on VirusTotal and by 4 out of 35 sources on URLVoid, indicating an active credential harvesting portal designed to capture Amazon account credentials under the pretense of a security verification step. No attachment was identified in this email sample..

5. ARTIFACT ANALYSIS

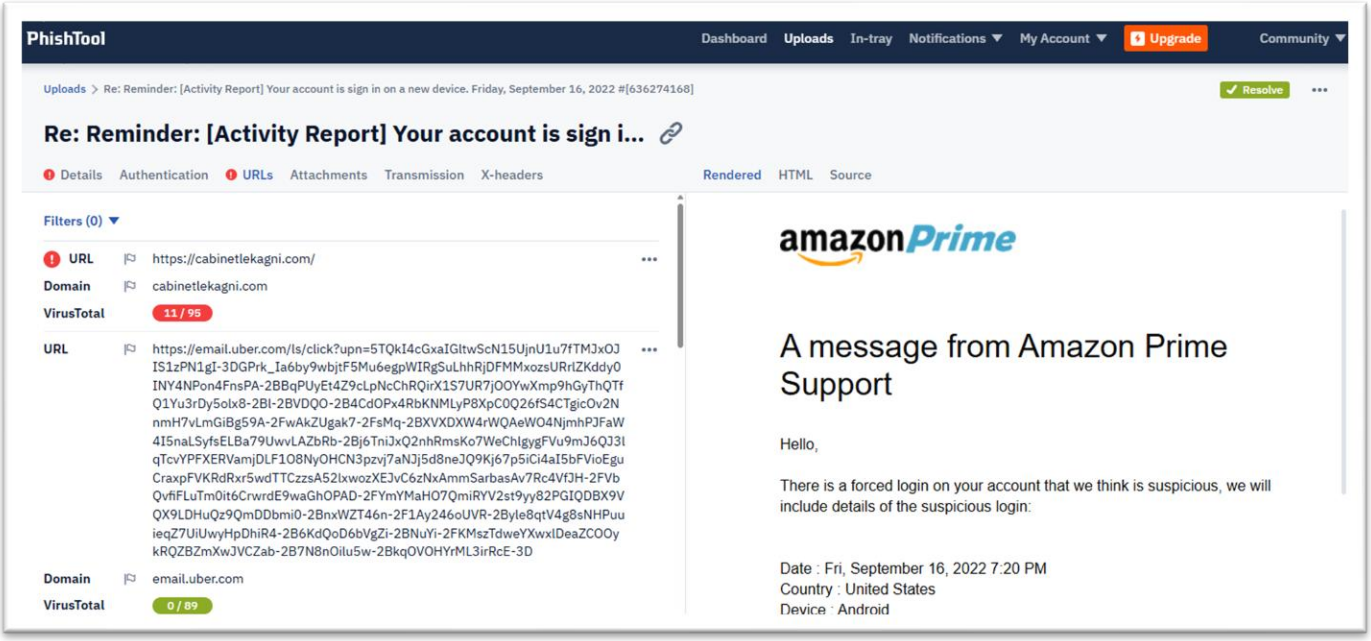
Sender Analysis: Although claiming to be from Amazon Prime, the From address cafepress@mail.cafepress.com clearly indicates a mailbox originating from an unrelated domain with no affiliation to Amazon. The Return-Path header exposes a completely different bulk mail domain, imdreampores.ovh, and the sender IP 209.85.221.104 resolves to a Google mail server, mail-pf1-f420.googlegroups.com, neither of which are affiliated with Amazon or the claimed sending domain, strongly indicating that the email was relayed through a compromised or rented third-party sending infrastructure to evade detection. Furthermore, all three email authentication checks, SPF, DKIM, and DMARC, returned failure status, confirming that the email does not originate from any authorized source for the claimed domain.

URL Analysis: After performing a URL reputation check using VirusTotal and URLVoid, the URL embedded within the call-to-action button of this email, hxxps://cabinetlekagni.com, was found to be malicious, as it redirects to a phishing website disguised as an Amazon Prime login page, flagged by 11 out of 95 engines on VirusTotal and detected by 4 out of 35 sources on URLVoid. It appears to be hosting a credential capture page that, when submitted, will log and steal the Amazon account credentials of any victim who interacts with it.

6. VERDICT

Due to the original sender being unaffiliated with Amazon, this email is a clear impersonation and spoofing attempt, with the From address belonging to an entirely unrelated domain, the Return-Path revealing a bulk mail domain with no connection to Amazon, and the sender IP resolving to a Google mail server, none of which are consistent with legitimate Amazon communication. Additionally, after analyzing the URL contained in the email's call-to-action button, hxxps://cabinetlekagni.com, it was flagged as malicious by 11 out of 95 engines on VirusTotal and by 4 out of 35 sources on URLVoid, confirming it redirects to a credential harvesting page disguised as an Amazon Prime login portal, a tactic commonly associated with phishing toolkits such as PhishPool.

1. PhisPool Flagged this as malicious



7. REACTIVE AND PROACTIVE MEASURES

Reactive Measures

The following actions were taken in direct response to the confirmed phishing email to contain the immediate threat. A message trace was performed to confirm no other users within the organization received the same email from this sender or with this subject line. The sender address cafepress@mail.cafepress.com was blocked on the email gateway to prevent any further emails from this address reaching the organization. Any incoming emails containing the return path domain imdreampores.ovh were blocked on the email gateway due to its confirmed association with the malicious sending infrastructure. The malicious domain cabinetlekagni[.]com was blocked on the email gateway to prevent delivery of any further emails referencing this domain, and was additionally blocked on the EDR and Web Proxy to ensure no user within the organization is able to access the credential harvesting portal through any means.

Proactive Measures

The following measures are recommended to reduce the organization's exposure to similar phishing attacks in the future. DMARC, DKIM, and SPF policies should be reviewed and enforced with a reject or quarantine policy to prevent spoofed emails from reaching user inboxes. Multi-factor authentication should be enabled across all user accounts, particularly for email and cloud services, so that even if credentials are harvested through a phishing portal they cannot be used to gain unauthorized access. Email gateway rules should be configured to flag or quarantine emails where the From address domain does not match the Return-Path domain, a reliable indicator of sender spoofing as observed in this sample. Regular phishing simulation exercises and user awareness training should be conducted to improve employee ability to identify and report suspicious emails before interacting with embedded links. Threat intelligence feeds should be integrated with the EDR and web proxy to enable automated blocking of newly identified malicious domains and IPs in near real time.

8. INDICATORS OF COMPROMISE (IOC SUMMARY)

Type	Indicator	Description
Sender Email	cafepress@mail.cafepress.com	Spoofed sender address impersonating Amazon Prime
Return-Path Domain	imdreampores.ovh	Unrelated bulk mail domain used for email delivery
Return-Path Address	bounces-098020-32419@tbh51blx.imdreampores.ovh	Actual bounce address revealing true sending infrastructure
Sender IP	209.85.221.104	Google mail server used to relay phishing email
Resolve Host	mail-pf1-f420.googlegroups.com	Resolved hostname of sender IP, unaffiliated with Amazon
Malicious URL	hxxps://cabinetlekagni[.]com	Credential harvesting page disguised as Amazon Prime login
Message-ID	Ti6MiLxTCWMiAH1sP7JxbGrEJIqKsD3Nv4CKIa8Mwrs@mail-pf1-f420.googlegroups.com	Unique email identifier for tracking and correlation
